Pull request:		
Description <p>We should move to use librarian-puppet instead of submodules to build the installer RPM, probably consuming our published modules from Puppet Forge. This will let us pin modules according to semver in stable branches too, making it easier to make bug fix releases.</p> <p>We also need to make it easy for installer maintainers to release the modules if we're doing this (currently I do it by hand). Probably a short script in the installer repo or in each module to handle the release would work. It could have the maintainer enter a version number, get them to update the changelog, update the Modulefile, rebuild it, commit it and tag the repo, then upload the resulting module.</p>
