<b>Description</b> Hello , I would like to suggest an idea of mine that I believe could help improve administration of multiple sites with foreman . IMHO , adding a new var for location could save one the trouble of creating multiple installation medias for different sites , repo etc . By adding a location var , you could for example , choose in the host's setting it's location and it will add the location to wherever the \$location var is used .like: <a href="http://file.\$location.&amp;lt;orgname&amp;gt;.com/path">http://file.\$location.&amp;lt;orgname&amp;gt;.com/path</a>
