Description

Currently the error message when a rendering fails isn't very good and is ugly. We should make it better, especially when spoofing is used.

This is much better now - both the preview from the Host page and the in-editor preview will correctly show errors. Eg I created a template of "<%= nosuchvar%>" and tried to preview it:

There was an error rendering the Basic gPXE bugday template: undefined local variable or method `nosuchvar' for #<#<Class:0x007f8ca1d74e90>:0x007f8ca1d87888>

Seems fine, re-open if there's more :P
