Pull request:			

Description

Currently katello-disconnected allows you to sync CDN repos and then export the content to ISO archives. This is fine for getting content shipped manually from the disconnected host to the Katello instance.

For situations where the Katello host has direct network access to the katello-disconnected host it would be very useful to be able to sync content directly from the http://example.com/pulp/repos directory on the system.

We need an additional command that allows the user to publish the synced content without having to perform a full export.
