Pull request:			

Description

1) Goto Roles
2) Select "Filters and Permissions" next to a Role
3) Select New filter
4) Select "Architecture" or "Compute Resource" under resource type

Error reported in the server..

NameError (undefined local variable or method `scoped_search_definition' for #<Class:0x0000000c7d4f18>):

- Subject changed from Unable to set permission filters to undefined local variable or method `scoped_search_definition' setting when setting

permission filters

- Status changed from New to Need more information

Can you add some debug and work out what class it's failing on? Especially if you have plugins like Katello installed, since I can't replicate this on a clean Foreman installation.

It would appear from a quick code inspection that the class might not be using scoped_search, but is responding to search_for (i.e. that it's "granular" according to Filter#granular but the class doesn't respond to scoped_search_definition).

- Status changed from Need more information to New

Oh, I think I see... [#5664](#) starts using .scoped_search_definition, but this was only added in scoped_search 2.7.0 while we depend on >= 2.6.2.

Please try updating scoped_search to >= 2.7.0 and see if that fixes it.

#4 - 05/22/2014 01:25 PM - Partha Aji

Worked with scoped_search to >= 2.7.0 . Thanks!. Can ya update it in develop ?
