Installer - Bug #5894

Passenger apache configuration doesn't get generated/updated

05/23/2014 04:22 AM - Derrick Hammer

Description

I recently upgraded to v1.5. I ran foreman-installer after. It seems there was an error introduced with the passenger conf. I renamed the file and re-ran the installer. The file wasn't re-created.

I had to install ruby193-mod_passenger and copy its passenger.conf to get the panel functional.

We're not able to generate this really from the installer as its contents are very platform-specific, so we have to rely on what's in the OS package (as it may refer to specific paths and varies across distributions & versions). Instead, the puppetlabs-apache module excludes the file from being purged, but if it's renamed then this will indeed be deleted by Puppet.

Sorry, I'm not sure there's anything we can do to fix this. I'd recommend using "yum reinstall mod_passenger" to restore it if you lose the original.
