Foreman - Bug #6213

Issue with selecting hostgroup after selecting deploy target

Description

On Foreman 1.5, if you select a deploy target first and then pick a host group with an associated compute profile, the fields in the Virtual Machine tab are not updated to match the compute profile. Steps to reproduce:

1. Go to New Host
2. Select a target from Deploy on
3. Select a host group which has an associated compute profile
4. Look at the Virtual Machine tab and see that the fields haven't been updated appropriately.

Not sure if this is a bug or not, but it's confused a few of my users when they've created a host.

Thanks,

Andy
