Description

Dynflow Action tests in general don't let us execute sub plans. Take the example of product delete, whose destroy plan does something like

1) Delete each repo of the product, using the repo delete orchestration
2) Delete candlepin artifacts.
3) Destroy the AR/elastic presence of the product

Now suppose I wanted to test the following scenario. "I want product delete to fail if one of the repo deletions fail due to some validation error". There is no way for me to test that. Because the action unit tests will not execute the repo delete orchestration.

History

#1 - 07/08/2014 06:31 AM - Ivan Necas

I don't think this needs to be tested, as that's the properly of the Dynflow.

#2 - 07/30/2014 12:08 PM - Ivan Necas

- Status changed from New to Rejected

I would suggest for the unit tests to keep the behavior as it is. If we want some more complex tests, it should happen outside of the unit testing framework for the end-to-end tasks tests
