Description	
<p>Using API v2 to be able to iterate all my objects that can have parameters set to store them in source control, however I ran into an issue where the server spits out a 500 error if the object doesnt have any parameters defined, example:</p>	
<p>Org ESXi has no params set at the organization level</p>	
<p>GET api/v2/organizations/:id returns:</p>	
<p>snip</p>	
<pre>"parameters": [],</pre>	
<p>GET api/v2/organizations/:id/parameters returns:</p>	
<pre>{ "error": { "message": "undefined method `paginate' for {}:Hash" } }</pre>	
<p>I guess i could work around this with logic, however it appears that something is returning just a hash instead of an empty hash nested in an array that can have the paginate method called.</p>
