<b>Description</b>	
<p>I've created a Centos 7 installation media because the \$minor doesn't work in the url.</p> <p>I assigned it to the Centos 7.0 OS and assigned it to a host group.</p> <p>But when I try to save a host with Centos 7.0 as operating system selected, I get the message:</p> <p>"CentOS mirror does not belong to CentOS 7.0 operating system" which is correct because it doesn't belong there, I cannot select the "Media" field and it should choose the Centos7 mirror</p>	

## History

### #1 - 08/11/2014 04:53 AM - Jorick Astrego

When I assign the CentOS mirror, I cannot install because the url "[http://mirror.centos.org/centos/7.0/os/x86\\_64/LiveOS/squashfs.img](http://mirror.centos.org/centos/7.0/os/x86_64/LiveOS/squashfs.img)" doesn't exist

### #2 - 08/11/2014 04:57 AM - Dominic Cleal

- Category set to Host creation

### #3 - 08/11/2014 09:18 AM - Jorick Astrego

It appears to be simply the problem that the Name field doesn't check if it's unique.

I justfilled in Centos and major 7.

Now I changed the name to Centos7, deleted the hosts (otherwise it doesn't work) and things started working

### #4 - 08/12/2014 07:24 AM - Jorick Astrego

Ah it was not my mistake, foreman creates it by itself. I now have three Centos Operating Systems, with two named just "Centos"
