Description

i can't change the host-group of a (virtual) host, that has no mac-address configured, because the hosts model complains when i try to save.

```
There were problems with the following fields:

Mac has already been taken
Mac can't be blank
Mac is invalid
```

if you don't aim to manage that host (provisioning wise), then simply click on the manage/unamange link (top right corner when editing a host).
