I have started working on this but it won't be part of the foreman project hence the name "lazyadmin". I don't have any project website yet but once I get one up I will update the ticket. The goal of the project is to be able to perform puppet/foreman/admin tasks while lying in bed with a few simple clicks (taps or gestures). Lazy admin is basically extending the current foreman web client with some additional features. When complete you should be able to hand your mobile device to your sister and have her install apache with a few simple clicks.

This mobile client will be available for the following devices

iOS
Android
- Blackberry
