Description	
<p>Puppet has a nice module documentation feature outlined here: http://projects.puppetlabs.com/projects/1/wiki/Puppet_Manifest_Documentation</p> <p>It would like to be able to retrieve parts of this documentation when calling the puppetclasses api so that it passes it back through json.</p> <p>http://foreman:port/puppetclasses</p> <p>So in addition to the name and id that gets returned I would like to see the following at a minimum:</p> <p>description: "This class installs our default set of users in our servers"</p> <p>Example:</p> <pre># Class: users # # This class installs our default set of users in our servers # # Parameters: # \$starting_uid: # this global variable is used to set the minimum uid used for our users # # Actions: # Install the default set of users: [dana,fox] # # Requires: # - Package["zsh"] # # Sample Usage: #</pre>

I was told by puppetlabs this can be done with rdoc or puppet doc. Looks like smart proxy will need a new feature to query modules for this information.
