Foreman - Support #8826

Deep nested Hostgroup does not apply their own parameters or don't receove them on some run

Description

I'm facing some issue which I cannot figure out.

I have a very deep nested hostgroup with parameters from one of his earlier parents.

1 -> 2 -> 3 -> 4 -> 5 -> 6

My group split is from 4.

When I override my paramater which is set in 4 in group 6 it still applies the paramaters from group 4.

I thought and was quite sure that this wasn't happening in smaller parent/child relations ships.

Is this a bug or am I doing something wrong ?

I'm getting the feeling that deep nested groups give issues on what the host receives in his catalog, this might be due database load it get's on deep nested groups ? It sometimes doesn't get a parameter and a manual run, but on the second one it gets it.

History

Seem to be happening due some dhcp change.
