Description Currently, when having action that are not represented by it's own permission (such as canceling a task requires `edit_task` as opposed to `cancel_task` permission) one needs to define the mapping both when defining the permissions (<code>`permission { 'api/tasks' => [:cancel] }`</code>) for checking the routes, and redefine the `action_permission` in the controller for `find_resource` purposes. It would be more convenient if the `action_permission` method would be able to load the needed permission from the permission definition (overriding would still be possible if needed).
