Description	
<p>I'd like to see an option in foreman-installer which configures a suburi for the foreman interface.</p> <p>Currently it is assumed that the root of apache will be used, but this is painful for hosts that serve other content, or are behind reverse proxy'd.</p> <p>This can be configured quickly by hand, but if the foreman-installer is run again, changes are overwritten.</p> <p>Please see this forum post for config changes: https://groups.google.com/forum/#!searchin/foreman-users/reverse/foreman-users/xQMBbHOKkI4/5vQ4F9xtIHgJ</p>

I think this has been implemented in nightlies (1.8) via <https://github.com/theforeman/puppet-foreman/pull/245>. It suggests the following command:

```
foreman-installer --foreman-foreman-url="https://example.com/foreman" --foreman-proxy-foreman-base-url="https://example.com/foreman"
```

You may also now need --puppet-server-foreman-url, but I've not tried it.
