Category:	API	
Target version:		
Difficulty:		Fixed in Releases:
Triaged:		Found in Releases: 1.7.2
Bugzilla link:		Red Hat JIRA:
Pull request:		

Description

After upgrading from 1.6.x to 1.7.2 I am facing the exact same issue as described in bug [#7989](#).

Trying to create a host returns error:
"operatingsystem_id is not allowed as nested parameter for hosts. Allowed parameters are hostgroup_id, location_id, organization_id, environment_id"

If any further information is helpful please let me know.

History

Sorry, apparently my POST request was actually incorrect but correct enough to pass in old versions of Foreman.

I sent my data as: { key: value, key2: value }

When I should have sent: {'host': { key: value, key2: value } }
