Pull request:	
Description It'd be nice if in the "parameter" pages (Global, and per node) we had the ability to cut/paste a CSV file with: var1,value1 var2,value2 var3,value3 var4,value4 And have those populate the global and per-node ENC parameters. This functionality would allow external teams to provide us with the values needed to provision/support/upgrade in a format that they can understand (standard spreadsheet) I realize this can probably be done via the REST api, but it seems like this should be a part of basic functionality.	
Related issues: Is duplicate of Foreman - Feature #563: Allow import and export "parameters" ... Resolved 01/04/2011
