Description Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1182367 Title: Configuring LDAP Authentication for Red Hat Satellite Describe the issue: LDAP settings are configured, but user cannot login. Suggestions for improvement: This is more a request than a bug, but there needs to be a "Test LDAP Connection" button with a viewable error message. Nowadays almost all enterprise products have this feature. Having to debug user login errors without being able to first confirm your LDAP settings even work creates a hassle when troubleshooting. The settings in the instructions are very vague as well as to what works and what doesnt. These details should be expanded out as well. Additional information: Using Red Hat Satellite 6 running on RHEL 6.6.
