Description	
<p>When I provision a virtual machine using libvirt, kvm and lvm it would be nice with an extra field where you can put the name extension on the volume that gets created for the virtual machine.</p> <p>For example, I create a machine with four virtual disks. One for root, one for home, one for var and one for tmp. I would like to be able to name them: fqdn-root, fqdn-home, fqdn-var and fqdn-tmp. Today the name is forced to fqdn-disk1, fqdn-disk2 etc..</p>
